DETAILED BUG REPORTS (BYJCHS PROJECT)

Bug ID: BYJ-001 | Document Overview Cards Are Misaligned on Dashboard

SEVERITY	Low	PRIORITY	P4 – Low
----------	-----	----------	----------

Environment	OS: Windows 10/11 Browser: Chrome 124, Firefox 125 Device: Desktop
Module / Page	Home → Dashboard → Document Overview
Reported By	Rida Khan – SQA Engineer
Date Reported	18 oct 2025
Status	Open

PRECONDITIONS
1. User is logged in with Admin credentials. 2. Dashboard is fully loaded and document overview section is visible.

#	STEP
1	Open the application URL in a supported browser.
2	Log in using Admin credentials.
3	Navigate to Home → Dashboard.
4	Locate the 'Document Overview' section containing the cards: Uploaded, Approved, Rejected, Pending.
5	Observe the alignment and spacing between each card.

EXPECTED RESULT	ACTUAL RESULT
All four Document Overview cards (Uploaded, Approved, Rejected, Pending) should be evenly spaced and horizontally aligned, maintaining consistent margins and padding across all viewport sizes.	The cards appear misaligned with inconsistent spacing between them. The layout is uneven — some cards are closer together while others have wider gaps, causing a visually broken dashboard layout.

SEVERITY JUSTIFICATION	PRIORITY JUSTIFICATION
Low — This is a purely cosmetic/visual defect. Application functionality is unaffected. All data is accessible and the UI remains usable.	P4 – Low — Does not block any user workflow. Can be addressed in a future UI polish sprint without impacting release timelines.

Bug ID: BYJ-002 | Vertical Scrollbar Overlaps Document Overview Section on Dashboard

SEVERITY	Low	PRIORITY	P4 – Low
----------	-----	----------	----------

Environment	OS: Windows 10/11 Browser: Chrome 124, Firefox 125 Device: Desktop
Module / Page	Home → Dashboard
Reported By	Rida Khan – SQA Engineer
Date Reported	18 oct 2025
Status	Open

PRECONDITIONS
User is logged in with Admin credentials. Dashboard page is loaded with enough content to trigger a vertical scrollbar.

#	STEP
1	Open the application in a supported browser.
2	Log in as Admin.
3	Navigate to Home → Dashboard.
4	Ensure the page has enough content to display a vertical scrollbar.
5	Scroll down slowly using the scrollbar or mouse wheel.
6	Observe the scrollbar's position relative to the Document Overview cards.

EXPECTED RESULT	ACTUAL RESULT
The vertical scrollbar should appear within its dedicated gutter area (far right of the viewport). It should not overlap or cover any dashboard content. Sufficient right-side padding should be maintained.	The vertical scrollbar visually overlaps the Document Overview boxes from the right side, cutting into the card content and causing visual clutter.
SEVERITY JUSTIFICATION	PRIORITY JUSTIFICATION
Low — Cosmetic defect only. Scrolling functionality works; no data is hidden or inaccessible. Visual overlap does not prevent user interaction.	P4 – Low — Does not affect core functionality or data access. Low business impact. Fix can be scheduled in a CSS cleanup sprint.

Bug ID: BYJ-003 | Application Logo and Sidebar Icons Are Non-Clickable

SEVERITY	Medium	PRIORITY	P2 – High
Environment	OS: Windows 10/11, macOS Browser: Chrome 124, Firefox 125, Edge 124 Device: Desktop		
Module / Page	Global Navigation — Header Logo & Sidebar Icons		
Reported By	Rida Khan – SQA Engineer		
Date Reported	17- oct-2025		
Status	Open		

PRECONDITIONS
User is logged in with any role (Admin, User). The application sidebar and header are fully rendered.

#	STEP
1	Open the application in any supported browser.
2	Log in with valid credentials.
3	Once on the Dashboard, locate the application logo in the top-left header area.
4	Click on the application logo.
5	Observe whether any navigation or redirect occurs.
6	Next, locate the sidebar icons (e.g., Home, Documents, Settings).
7	Click on each sidebar icon.
8	Observe whether any navigation or redirect occurs.

EXPECTED RESULT	ACTUAL RESULT
Clicking the application logo should redirect the user to the Homepage/Dashboard (standard UX convention). Each sidebar icon should navigate to its corresponding page. All icons should display pointer cursor on hover and respond to click events.	The application logo and all sidebar icons are static and non-interactive. Clicking on them produces no response — no navigation, no hover cursor change, and no visual feedback. Users are forced to use alternative navigation methods.

SEVERITY JUSTIFICATION	PRIORITY JUSTIFICATION
Medium — While the application remains functional via other navigation paths, non-clickable logo and icons represent a significant UX regression that violates standard web conventions and user expectations.	P2 – High — Navigation is a core UX component. Non-functional sidebar icons affect every user session across all roles. This should be fixed before the next production release.

Bug ID: BYJ-004 | Page Refresh on Edit User Form Redirects to User List Instead of Reloading Form

SEVERITY	Medium	PRIORITY	P2 – High
----------	--------	----------	-----------

Environment	OS: Windows 10/11 Browser: Chrome 124, Firefox 125 Device: Desktop
Module / Page	Admin Panel → User Management → Edit User
Reported By	Rida Khan – SQA Engineer
Date Reported	17 oct 2025
Status	Open

PRECONDITIONS
User is logged in as Admin. At least one existing user record is present. Admin is on the Edit User form with user data loaded.

#	STEP
1	Log in as Admin and navigate to the User Management section.
2	Click the Edit button for any existing user record.
3	Verify that the Edit User form opens with the selected user's data pre-populated.
4	Without submitting the form, press Ctrl+R (or F5) to refresh the browser page.
5	Observe the page the system lands on after the refresh.

EXPECTED RESULT	ACTUAL RESULT
After a browser refresh on the Edit User form, the page should reload the same Edit User form with the same user's data still populated (data fetched via URL parameter or session state). The user should remain in their current editing context.	The system redirects to the User List page upon refresh instead of reloading the Edit User form. Any unsaved changes are lost and the user must manually navigate back to find and reopen the same record.

SEVERITY JUSTIFICATION	PRIORITY JUSTIFICATION
Medium — Data loss risk (unsaved edits discarded on refresh). Disrupts admin workflows, particularly when editing complex user records. Does not break core functionality but causes significant inconvenience.	P2 – High — Affects all Admin users performing edits. Frequent browser refreshes are common; unexpected redirections erode trust in the system. Should be fixed before the next sprint release.

ATTACHMENTS / LOGS

Bug ID: BYJ-005 | No Indication of Accepted File Formats in Upload Files Field on Edit Document Form

SEVERITY	Medium	PRIORITY	P3 – Medium
----------	--------	----------	-------------

Environment	OS: Windows 10/11 Browser: Chrome 124, Firefox 125 Device: Desktop
Module / Page	Documents → Edit Document → Upload Files
Reported By	Rida Khan – SQA Engineer
Date Reported	16 oct 2205
Status	Open

PRECONDITIONS

User is logged in with appropriate permissions to edit documents. An existing document record is available. User navigates to Documents → Edit Document.

#	STEP
1	Log in and navigate to Documents → Edit Document.
2	Locate the 'Upload Files' section on the form.
3	Observe the upload field — note any visible instructions or format hints.
4	Click on 'Click to upload'.
5	Attempt to upload a .png file. Observe system response.
6	Attempt to upload a .jpeg file. Observe system response.

7	Attempt to upload a .pdf file. Observe system response.
8	Finally, upload a valid .jpg file and confirm it is accepted.

EXPECTED RESULT	ACTUAL RESULT
The upload field should either: (a) Accept all common image formats (.jpg, .jpeg, .png) and display them correctly, OR (b) Clearly display supported format information — e.g., a tooltip, helper text, or label stating 'Accepted formats: .jpg only' — before the user attempts an upload, so upload failures are self-explanatory.	The upload field silently accepts only .jpg files. Attempting to upload .png, .jpeg, or .pdf results in an error, but no format restriction is communicated to the user upfront. No tooltip, helper text, or inline instruction exists to guide the user.

SEVERITY JUSTIFICATION	PRIORITY JUSTIFICATION
Medium — While data integrity is maintained, the missing instruction causes repeated user errors and confusion. Poor UX that may lead to support escalations in production.	P3 – Medium — No data loss or functional blockage, but a straightforward fix (adding helper text) that greatly improves UX. Recommended for inclusion in the next sprint.

ATTACHMENTS / LOGS

Bug ID: BYJ-006 | Search Bar is Non-Functional on All Documents Page — No Results Returned

SEVERITY	High	PRIORITY	P1 – Critical
----------	------	----------	---------------

Environment	OS: Windows 10/11, macOS Browser: Chrome 124, Firefox 125, Edge 124 Device: Desktop
Module / Page	Documents → All Documents → Search
Reported By	Rida Khan – SQA Engineer
Date Reported	16 oct 2025
Status	Open

PRECONDITIONS
User is logged in with access to the Documents module. The All Documents page contains at least one uploaded document (e.g., 'Sale Deed'). Search bar is visible on the All Documents page.

#	STEP
1	Log in and navigate to Documents → All Documents.
2	Verify that the document list displays at least one existing document.
3	Locate the Search input field on the page.
4	Type a valid document title into the search bar (e.g., 'Sale Deed').
5	Press Enter or wait for the auto-search to trigger.
6	Observe whether the document list filters to show matching results.
7	Clear the search field and type a partial match (e.g., 'Sale').
8	Observe search behavior again.

EXPECTED RESULT	ACTUAL RESULT
As the user types in the search bar, the document list should dynamically filter and display only records that match the entered keyword or document title. Pressing Enter should also trigger the search. Clearing the field should restore the full list.	The search bar produces no result. After typing a valid document title and pressing Enter, the document list remains completely unchanged — all documents continue to display with no filtering applied. The search functionality is entirely non-operational.

SEVERITY JUSTIFICATION	PRIORITY JUSTIFICATION
High — The search bar is a core feature of the document management module. Its complete failure directly prevents users from efficiently locating specific documents, degrading the product's primary use case.	P1 – Critical — Core document retrieval functionality is broken. In production, users with large document libraries cannot find records without manual scrolling. This should be treated as a release blocker and fixed immediately.

Bug ID: BYJ-007 | Invalid or Malformed URL Silently Redirects to Dashboard Instead of Displaying Error Page

SEVERITY	Medium	PRIORITY	P2 – High
----------	--------	----------	-----------

Environment	OS: Windows 10/11 Browser: Chrome 124, Firefox 125 Device: Desktop
Module / Page	Global — URL Routing / Error Handling
Reported By	Rida Khan – SQA Engineer
Date Reported	16 oct 2025
Status	Open

PRECONDITIONS

User is logged in with a valid session. Application is running. An invalid, malformed, or expired URL is available for testing (e.g., /users/edit/invalid-id or a wrong token link).

#	STEP
1	Log in to the application to establish a valid session.
2	In the browser address bar, manually type or paste an invalid URL (e.g., /users/edit/invalid-id).
3	Press Enter and observe where the application navigates.
4	Log out of the application.
5	Attempt to access an expired or malformed authentication link.
6	Observe the resulting page.
7	Also test with a completely random path (e.g., /gibberish/path/12345).

EXPECTED RESULT	ACTUAL RESULT
When an invalid, malformed, or non-existent URL is accessed, the system should display an appropriate error response — such as a 404 Not Found page, an 'Invalid Link' message, or a redirect to the Login page if authentication is required. It should NOT silently redirect to the Dashboard.	The application redirects the user to the Dashboard regardless of the URL entered. Invalid paths, expired links, and malformed resource IDs all result in a silent Dashboard redirect without any error message or feedback.

SEVERITY JUSTIFICATION	PRIORITY JUSTIFICATION
Medium — While not an immediate data security risk, this behavior suppresses error signals, potentially exposes internal routing logic, and prevents proper expired-link handling (e.g., password reset, email confirmation tokens).	P2 – High — Affects security posture and error handling completeness. Invalid URL handling is a baseline security and UX requirement. Should be resolved before production release.
